Heap Sampler is a client-side memory tool that combines easy-to-use snapshot, heap dump and memory profiling to help you identify memory leaks in your applications. Heap Sampler is based on OpenJDK's Hotspot JVM, and does not require any additional Java libraries. Features of Heap Sampler: * Snapshot Heap Sampler can create an easy-to-maintain snapshot of your heap to observe the current state of objects. Different snapshots can be compared to identify memory leaks, and also can be serialized and deserialized for debugging purposes. * Heap Dump Heap Sampler can create a complete heap dump of objects on the Heap for observing stack traces. * Memory Profiling The heap dump and memory profiling provide a tree view of allocation, garbage collection, and compaction activities. * Visualization To highlight hotspots in heap, a virtualized visualization engine will display a symbol in the tree view for each object. The visualization engine automatically adjusts when the heap is changed. * Debugging When a memory leak or other issues occur, the Heap Sampler can provide visual feedback, including stack traces, variable names, method names, line numbers, and file names. A good API design and implementation is a balance of functionality and maintenance. Managing dependencies, versioning, and ensuring stability and security is part of what makes a good API design.
